QueryPony is an easy-to-use application for connecting to and managing SQL databases. With this application, you can view SQL statements and export queries to the clipboard for pasting into an application or text editor. Also, this application enables you to connect to a database from within a running program. A network driver for 3D games. It provides a framework and a set of classes for easily building networked clients and

servers. The framework is based on a game loop which enables asynchronous communication. CNet is included in the game package, and a DLL may be installed into another game package, and will provide the ability to seamlessly integrate with games which do not ship with the CNet framework. Like Seq3D, but for the case where, instead of having a single sequence, you have a table with multiple sequences. The database in question is composed of 4 tables: 1.

main_seq_tbl -- contains the primary sequences for the jobs and materials 2. seq_no_tbl -- contains the jobs and materials per sequence 3. job_tbl -- contains the information about the job 4. mat_tbl -- contains the information about the materials Sequence Editor provides fast and easy way to add sequences to your database. The application is based on Oracle's Sequenced Data Type for defining your sequences. Sequences may be defined on the fly, or you can upload them from

your file manager or from your SQL database. There is also an option to convert your existing sequences to Sequenced Data Type. In case that your sequences are defined in your database, you can upload them with Sequencer as well. In this way, you can add Sequence in very short time. The Sequencer is a stand alone tool. In addition, you can define sequences directly from the editor. There is an option to attach your sequences, or copy their definitions. Seq3D is a 3D sequencing application that

can read and write SBS files with multiple sequences. It can also generate sequence files for a job / sequence combination. Sequences and job information can be entered through a GUI or saved from a file manager. Database tables can be created and loaded from SQL or a file manager. The GUI allows you to view, add, delete, and edit sequences and view the associated information. You can also sort sequences and view the results. Seq3D Description: Seq3D is a lightweight, free, 3

Microsatellite instability (MSI) in colorectal cancer (CRC) is a major prognostic marker, but is based on

molecular instability of two specific sequences (BAT26 and BAT25) and therefore, may fail to detect some of the unstable genome. Here, we investigated whether BRAF mutation can serve as an independent prognostic marker in stage II/III CRC. A cohort of 118 stage II/III CRC patients with complete microsatellite data, together with BRAF mutation data, were investigated in order to study whether BRAF mutation, MSI, and their combined occurrence were

associated with patients' outcome. Median follow-up time was 5.7 years. The influence of various clinical and molecular markers on survival were analysed using Kaplan-Meier plots and multivariate Cox regression. BRAF mutation was found in 8% of the cases, and correlated with significantly shorter time to recurrence (P=0.01) and shorter overall survival (OS) (P=0.02). After adjusting for known prognostic factors, the hazard ratio (HR) for OS was 4.04 [95%

confidence interval (CI) 1.04-16.3; P=0.04]. Multivariate analysis indicated that the combination of BRAF mutation with MSI was an independent prognostic factor (HR 4.71; 95% CI 1.02-21.6; P=0.05) and this was further supported by a subgroup analysis of stage II and III patients only. No influence of BRAF
