## VM Optimizer [Latest 2022]

VM Optimizer is a powerful tool that automatically reduces your Microsoft Windows based virtual machines to their smallest possible size and enhances the performance of your Microsoft Windows-based virtual machines. The two main features of VM Optimizer are 1) SmartRipper: a tool that auto-detects performance of the underlying host file system and optimizes your VM files to the best possible size based on the discovered performance of the underlying host file system, and 2) OptimizeVirtualHardDisk: a tool that re-sizes VMs based on the discovered size of underlying virtual disks, improving the performance of your Microsoft Windows-based VM images. The first feature is primarily useful if your Microsoft Windows-based virtual machine file is located on your host's file system. The file size of the host file system could affect the performance of Microsoft Windows-based virtual machines. Due to the fact that the size of host file system could affect the performance of your Microsoft Windows based virtual machines, it is often of interest to consider shrinking host file systems. Although there are many anti-virus or computer clean-up programs that can try to determine the appropriate size of the host file system, there are no existing programs or Microsoft Windows utilities that can determine the true performance of your host file system, even if such a tool did exist. The second feature is potentially useful even if your Microsoft Windows based virtual machine file is located on NTFS partitions of your host file system. VM Optimizer provides a tool that only takes the existing size of the virtual hard disk file and shrinks them to a minimum size. This is not something that you can do manually. VM Optimizer will report the size of any VMs that are smaller than 10 Gb due to the fact that the actual size of the VMs is less than 10 GB. The VMs are trimmed to 10 GB before further operations. VMs that are larger than 10 Gb are not trimmed. VM Optimizer does not use space on the host file system for storing intermediate results or temporary files. This means you will be able to see reduction even faster if you do not have much free space on your host file system. The SmartRipper tool in VM Optimizer is made to determine the exact impact on performance in your virtual machines. As a result, it can be difficult to determine whether you are getting the maximum performance or only a part of the performance improvements from VM Optimizer. The OptimizeVirtualHardDisk tool is only able to determine the
